Evolutionary Developmental Biology Of Invertebrates

Developmental biology is the study of the process by which animals and plants grow and develop. Developmental biology also encompasses the biology of regeneration, asexual reproduction, metamorphosis, and the growth and differentiation of stem cells in the adult organism.. In the late 20th century, the discipline largely transformed into evolutionary developmental biology

In the 1920s and 1930s the so-called modern synthesis connected natural selection and population genetics, based on Mendelian inheritance, into a unified theory that applied generally to any branch of biology. The modern synthesis explained patterns observed across species in populations, through fossil transitions in palaeontology, and complex cellular mechanisms in developmental biology.

1. INTRODUCTION - OVERVIEW - Biology as a science deals with the origin, history, process, and physical characteristics, of plants and animals: it includes botany, and zoology. A study of biology includes the study of the chemical basis of living organisms, DNA. Other related sciences include microbiology and organic chemistry.

Morphology, in biology, the study of the size, shape, and structure of animals, plants, and microorganisms and of the relationships of their constituent parts. The term refers to the general aspects of biological form and arrangement of the parts of a plant or an animal. The term anatomy also refers to the study of biological structure but usually suggests study of the details of either gross ...

The research interests and experience within this laboratory falls into the area broadly defined as evolution of developmental mechanisms. Our particular approach for understanding conserved and divergent properties of animal development is to compare architectural organization of gene regulatory networks (GRNs).

Sexual reproduction is a method for producing a new individual organism while combining genes

from two parents. A single sperm and egg fuse during fertilization , and their genomes combine in the new zygote .Sperm are small and contain little more than the father's genes.

Figure 1: The life history events of mammals, such as development, reproduction, and aging, typically occur in proportion to the entire lifespan. (Adapted from de Magalhaes and Sandberg, 2005.). Of course, invertebrates are distant animal models and these findings may not be representative of human biology, but they demonstrate how, at least in some species, aging is to a large degree a result ...

The categories listed below are those that will be used at the Intel ISEF 2019. Local, regional, state and country fairs may or may not choose to use these new categories, dependent on the needs of their area. Please check with your affiliated fair(s) for the appropriate category listings at that level of competition.
