

## *Wireless Sensor And Robot Networks From Topology Control To Communication*

## Wireless Sensor And Robot Networks

A wireless ad hoc network (WANET) or MANET (Mobile ad hoc network) is a decentralised type of wireless network. The network is ad hoc because it does not rely on a pre-existing infrastructure, such as routers in wired networks or access points in managed (infrastructure) wireless networks. Instead, each node participates in routing by forwarding data for other nodes, so the determination of ...

Session and Tracks. Track 1: Robotics A robot is a useful gadget, multitasking operator sketched to move objects, parts, tools or specific devices through variable programmed motions for the execution of a variety of tasks. Robots are the largest developing technological gadgets in the world. They perform many roles varying from space exploration to entertainment.

A sensor node, also known as a mote (chiefly in North America), is a node in a sensor network that is capable of performing some processing, gathering sensory information and communicating with other connected nodes in the network.A mote is a node but a node is not always a mote. List of Wireless Sensor Nodes

Sensors, an international, peer-reviewed Open Access journal. In wireless multi-hop networks, instead of using the traditional store-and-forward method, the relay nodes can exploit the network coding idea to encode and transmit the packets in the distributed coding-aware routing (DCAR) mechanisms, which can decrease the transmission number and achieve higher throughput.
